HIV-1. However, HIV-2 infection should be suspected in persons who have epidemiologic risk factors, including being from West Africa (where HIV-2 is endemic) or have sex partners from endemic areas, have sex partners known to be infected with HIV-2, or have received a blood transfusion or nonsterile injection in a West African country. HIV-2 testing also is indicated when clinical evidence of HIV exists but tests for HIV-1 antibodies or HIV-1 viral load are not positive, or when HIV-1 WB results include the unusual indeterminate pattern of gag (p55, p24, p17) plus pol (p66, p51, p31) bands in the absence of env (gp160, gp120, gp41) bands.

If HIV-2 infection is suspected, HIV-2 Immunoblot testing is available.

HIV Abs/WB

Western Blot Interp:	Positive	Abnormal	NEGATIVE	01
gp160 Ab	Present	Abnormal	Absent	01
gp120 Ab	Present	Abnormal	Absent	01
p65 Ab	Present	Abnormal	Absent	01
p55 Ab	Present	Abnormal	Absent	01
p51 Ab	Present	Abnormal	Absent	01
gp41 Ab	Present	Abnormal	Absent	01
gp40 Ab	Present	Abnormal	Absent	01
p31 Ab	Present	Abnormal	Absent	01
p24 Ab	Present	Abnormal	Absent	01
p18 Ab	Present	Abnormal	Absent	01

Interpretive Criteria (CDC/ASTPHLD):

Negative = No bands; No antibodies detected.

Positive = Any two of the following bands: P24, GP41, or GP120/GP160.

Inconclusive = Bands present, but inconsistent with positive criteria.

Persons recently seroconverting may have indeterminate results. If followed for 4-6 months, patterns become more typical. Persons in low risk groups may have indeterminate results which may be nonspecific and do not become typical with time.

Ambig Abbrev CMP12 Default
